

Moneytaur Trading Playbook

Decoded from @Moneytaur_ — Style, Strategy, Risk & Lessons

This document synthesizes the publicly-available trading philosophy of @Moneytaur_ — a technical crypto/futures trader known on X/Twitter for free educational threads on price action, risk management, and market structure. Source material was aggregated from Thread Reader App indexes, public search results, third-party repostings, and community GitHub projects that catalog his tweet archive (e.g. [vadimbacalov/moneytaurproject](#) and [SheikhEl6/moneytaur-pipeline](#)).

Scope note. *X/Twitter is auth-gated and cannot be scraped without a logged-in session. The observations below are distilled from publicly indexed snippets and summaries of his threads, not a full tweet-by-tweet dump. Treat this as an interpretation of his style — not investment advice.*

Handle	@Moneytaur_
Markets	Crypto spot & perpetual futures (BTC, ETH, majors, alts)
Approach	Technical — price action + selective indicators
Style	Trend-follower with sniper-precision entries ('refining')
Leverage	Comfortable at 20x+ because of tight stops
Teaching posture	Free content; combative toward 'TA experts'

1. Core Trading Philosophy

Moneytaur's worldview starts from a blunt premise: **crypto markets are engineered environments where wealthy participants extract fiat from retail**. He is openly skeptical of the 'Bitcoin as pure freedom money' narrative and treats price action as a game with identifiable rules that favor well-trained, disciplined operators.

From that, three convictions follow

- **Edge is technical and learnable.** He rejects the idea that trading is luck. Edge comes from repetition, level-mapping and emotional control.
- **All-weather skill over directional bet.** 'If you possess the skills to profit in any market condition, you won't get REKT when the top is in.'
- **Free teaching as signal.** He is confrontational toward paid-group 'TA experts' who, in his view, get stopped out on 2R trades.

2. Trading Style

2.1 Trend Trader — on every timeframe at once

Moneytaur describes markets as a **nest of simultaneous trends** across timeframes. His job is to identify the dominant trend on the timeframe he is operating on, align lower-timeframe entries with it, and refuse to fight higher-timeframe direction.

2.2 Price Action First, Indicators for Confirmation

Raw price structure — swing highs/lows, wicks, reclaims, rejections — is the primary input. Indicators are used to confirm, not to decide. He specifically calls out **USDT Dominance (USDT.D)** as a 'blatant signal with massive market impact' — rising USDT.D = risk-off for alts, falling USDT.D = risk-on.

2.3 Levels, Not Signals

*He trades **zones**, not triggers. Rather than rigid entry/exit rules, his framework is: map the key levels, wait for price to come to them, then ride the move with a trailing stop. 'Find levels and ride market moves while trailing stops' — not fixed entries and exits.*

3. The 'Refining' Method — his signature edge

Across his threads, Moneytaur names **refining** (and its upgraded form **ultra-refining**) as the single most life-changing skill in trading. It is the art of progressively zooming into lower timeframes to tighten the invalidation on a trade while keeping the target intact.

3.1 Why refining matters mechanically

- **Smaller stop → bigger R:R.** A 4R trade refined to a tighter invalidation can become 10R+ at the same target.

- **Smaller stop → higher usable leverage.** Because dollar risk stays constant, a tighter stop means position size can grow — this is how he justifies comfortable use of 20x+ without blowing up.
- **Leverage is a function of stop, not confidence.** You do not use 20x because you are sure; you use 20x because your stop is 0.2% away.

3.2 How he says to learn it

- Study content, then **recreate the charts yourself** on your own TradingView account — don't just read.
- Expect **weeks to months** of dedicated practice. 'Don't expect to perform at elite level in 1-2 months if you're not even a profitable trader yet.'
- Start with the higher-timeframe bias, then zoom down 2-3 timeframes to find the cleanest structural invalidation.

3.3 A refined entry looks like...

- 1) Identify the HTF key level (daily / 4H support or resistance).
- 2) Wait for price to arrive at the level — never chase.
- 3) Drop to 15m / 5m and look for a **reclaim, sweep, or structure break** that defines an invalidation wick.
- 4) Place the stop just beyond that wick. That is the refined entry.
- 5) Scale size from the new, tighter risk — not from conviction.

4. Risk & Money Management

4.1 Stop-loss is non-negotiable

Every trade has a stop. The stop is defined by **structure**, not a round percentage. If structure invalidates 0.25% away, that's your stop; if it's 2%, that's your stop — and you size accordingly.

4.2 Partial take-profits — the 35% rule

Rather than bringing a full position to the 'best case scenario' (BCS) target, Moneytaur advises **taking ~35% off while the trade is still running**. This does three things:

- Locks in realized P&L so the trade cannot round-trip to a loss.
- Leaves a meaningful runner for the extended move.
- Creates **ammunition to add back** if a new key level forms inside the trading range — he re-enters with *already-realized profit*, not fresh risk capital.

4.3 Trailing stops over fixed targets

For the remaining 65% runner, the exit is managed with a trailing stop behind structure — each new higher-low (longs) or lower-high (shorts) drags the stop up. You do not predict the top; you let the market take you out.

4.4 Leverage as a derived variable

Variable	Moneytaur's framing
Account risk	Fixed — e.g. 0.5–2% per idea
Stop distance	Determined by structure (refining tightens this)
Position size	$\text{Risk} \div \text{stop distance}$
Leverage	Whatever size requires — often 20x+ because stops are tight

5. Macro & Market-Structure Lenses

5.1 USDT.D as the dominant regime filter

Moneytaur treats **USDT Dominance** as the single most actionable macro chart for crypto. Rising USDT.D signals capital parking in stables — a bearish regime for alts. Falling USDT.D signals capital rotating out of stables — a bullish regime. Most of his alt longs require USDT.D to be breaking down or printing weakness.

5.2 BTC Dominance & TOTAL3

He uses BTC.D to time rotations (BTC-led legs vs alt legs) and TOTAL3 (market cap ex-BTC & ex-ETH) to read the alt-coin risk-on pulse. Alt setups improve when BTC.D rolls over while TOTAL3 holds higher-lows.

5.3 Skepticism toward BTC narratives

His critical view — that BTC is used by large players to extract fiat from retail — is not a thesis he trades directly. It's a **mental framing** that keeps him transactional rather than evangelistic, and comfortable shorting the very asset most of crypto refuses to short.

6. Psychology & Cognitive Biases

Moneytaur's thread on biases in trading (widely reposted, including on Instagram) emphasizes that **your edge is mostly the absence of bias**. The biases he calls out most often:

- **Confirmation bias** — seeking only charts/opinions that agree with your existing position. His counter: force yourself to write the bear case for your long, and the bull case for your short, before entering.
- **Recency bias** — over-weighting the last 3-5 candles or the last trade's outcome. One stopped trade does not invalidate a setup; one lucky winner does not validate breaking your rules.
- **Anchoring** — fixating on your entry price or a prior high. The market does not know or care where you got in.
- **Loss aversion / revenge trading** — the urge to 'win it back' after a loss. He explicitly flags this as a top account-killer.
- **FOMO** — chasing a move that already ran. If the level is gone, the trade is gone; wait for the next one.
- **Over-confidence after a win streak** — the most dangerous bias, because it scales up size right before a cluster of losses.

The practical antidote he repeats: **a written plan for every trade** — entry, invalidation, first TP, runner management — decided *before* you are in the position, when you are still rational.

7. Backtesting & Deliberate Practice

A recurring theme: most new traders refuse to backtest because it is 'boring and difficult.' Moneytaur's position is that backtesting is **how you earn the right to trade a strategy live** — it is the only way to see, in concrete numbers, how the setup would have behaved over weeks and months of past data.

His backtesting loop (reconstructed from his advice)

- Define the setup in writing — exact level criteria, trigger, stop, TP rules.
- Pick a representative period (bull leg, bear leg, chop) and replay bar-by-bar.
- Log every trade — R, outcome, what went wrong, what you'd refine.
- Compute hit rate, average R, max drawdown, and expectancy.
- Only size up live once the sample is statistically meaningful.

8. What He Avoids

- **Chasing**. If price has already left the level, the trade is over.
- **Moving stops**. A moved stop is a new, worse trade.
- **Averaging down** without a pre-planned level to do so.

- **Paid signal groups** that ship trades without invalidation.
- **Conviction trading** — taking bigger size because 'this one's obvious'.
- **All-in spot-only posture** in ranging or bearish regimes — he prefers smaller, leveraged, refined trades in both directions.

9. A Composite Moneytaur Trade — Start to Finish

A composite, not a specific call. This is how his rules chain together:

- **Regime.** USDT.D printing lower-highs on 4H — alt risk-on bias.
- **HTF bias.** ETH/USDT daily reclaimed prior range low — bullish.
- **Level.** 4H demand zone at the old range low acts as the 'come-to' level.
- **Refine.** On 15m, a sweep of the local low + reclaim prints an invalidation wick 0.4% below entry.
- **Sizing.** $1\% \text{ account risk} \div 0.4\% \text{ stop} = 2.5\text{x notional}$ — executed on 20x-capable perp with plenty of margin headroom.
- **Management.** First TP at 3R closes 35%. Stop trails to BE, then behind each new 15m higher-low.
- **Re-entry.** If a new 15m demand forms inside the move, add using *realized* 35% profit — not fresh risk.
- **Exit.** Trailing stop takes the runner out. No prediction of the top.

10. Key Lessons — One-Page Cheat Sheet

- Trade the level, not the candle.
- Refine until the stop is structurally small — that is your edge.
- Leverage is derived from stop distance, not from conviction.
- Take 35% off in-flight, trail the rest, re-enter with realized P&L.
- USDT.D tells you the regime — trade alts with it, not against it.
- Every trade is a written plan before you click.
- Backtest before you scale.
- All-weather skill beats directional bet.
- Don't fight higher-timeframe trend.
- No chasing, no revenge trades, no moved stops.

Appendix A — Sources & Methodology

The material above was synthesized from the following public sources. No tweets were directly extracted from X/Twitter (which requires authentication) — instead, publicly indexed summaries, quotes, and third-party reposts were used:

- Thread Reader App profile for @Moneytaur_ (threadreaderapp.com/user/Moneytaur_) — index of unrolled threads.
- **vadimbacalov/moneytaurproject** on GitHub — HTML directory of X search URLs bucketed by week from May 2021 to 2025; used to confirm posting cadence and topic continuity.
- **SheikhEl6/moneytaur-pipeline** on GitHub — Python template for an ingestion → ETL → enrichment → API pipeline scoped to Moneytaur data, indicating an active community archiving effort.
- Public search-engine snippets quoting specific Moneytaur lines on refining, leverage, R:R, USDT.D, partial TP, and backtesting.
- Third-party reposts (e.g. Instagram reshare of his 'biases in trading' thread) corroborating the psychology content.

***Caveats.** (1) This is an interpretation — direct quotes are paraphrased from indexed snippets and may be phrased differently in the original threads. (2) Trading style evolves; this reflects the publicly visible cross-section through early 2026. (3) Nothing here is financial advice.*

Appendix B — Suggested Next Steps for Deeper Research

- Log in to X and systematically unroll the weekly threads linked from *moneytaurproject* — the richest first-party source.
- Subscribe to his Thread Reader App page and export full unrolls.
- Build a personal replay-journal in TradingView to backtest his level + refine + 35%-TP template on your preferred pairs.
